

Homework 4

How to do it in SPSS

Open the data file

- Get the data file (from Github or myBU) and put it in a directory where you can find it later).
- Open the data file (Homework4_data_spss.csv) by selecting “Read Text Data...” from the File menu.
- This will open the Text Import Wizard
- (For the assignment, an SPSS .sav file is provided, so you can skip this step)

Text import wizard

- Press Next

Text Import Wizard - Step 1 of 6

Welcome to the text import wizard!

This wizard will help you read data from your text file and specify information about the variables.

Does your text file match a predefined format?

☐ Yes ☒ No

Browse...

Text import wizard

- Select “Delimited” (since the data are comma delimited)
- Select “Yes”, since the first line contains column names
- Press Next

Text Import Wizard - Step 2 of 6

How are your variables arranged?

☒ Delimited - Variables are delimited by a specific character (i.e., comma, tab).

☐ Fixed width - Variables are aligned in fixed width columns.

Are variable names included at the top of your file?

☒ Yes

☐ No

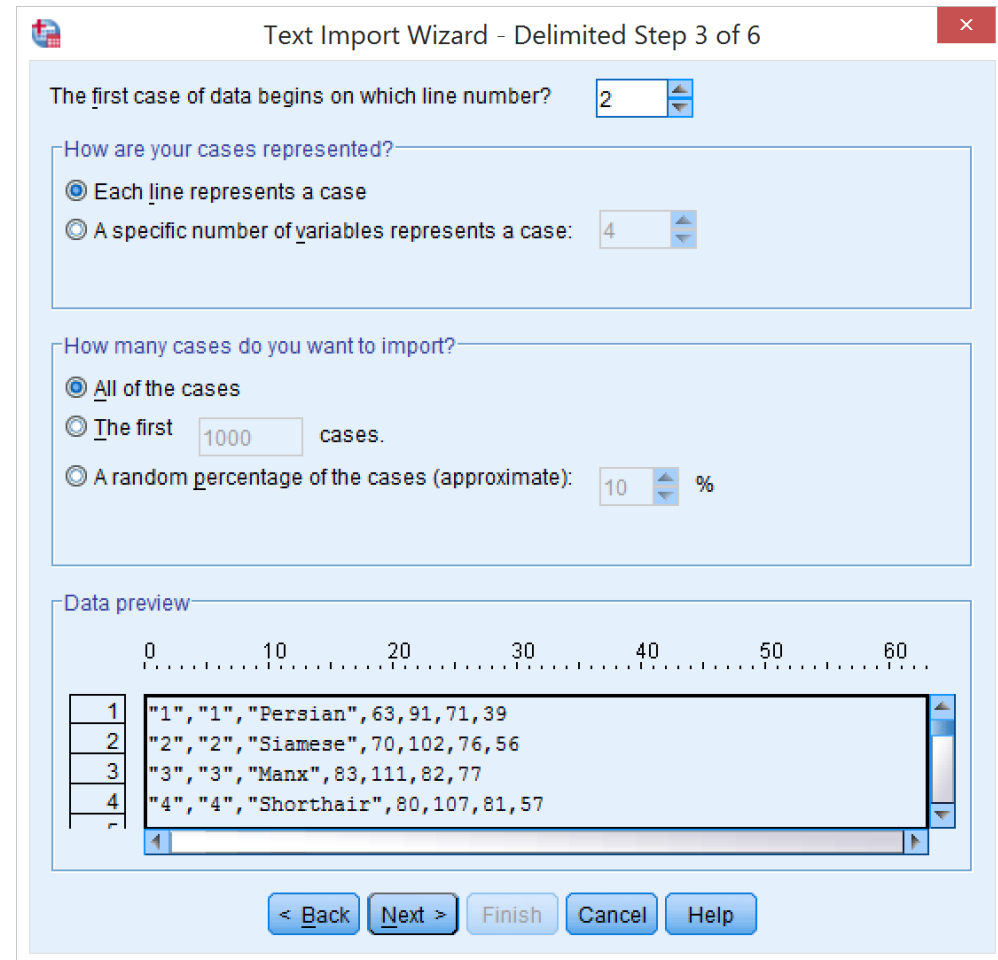

Text file: C:\Bernhard\Documents\Teaching\Winter 2014\Advanced Statistics\BU-adv-stats\Hon

Text import wizard

- These values should be correct, but double-check:
 - First case of data begins on line 2
 - Each line represents a case
 - Import all of the cases
- Press Next

The first case of data begins on which line number? 2

How are your cases represented?

☒ Each line represents a case

☐ A specific number of variables represents a case: 4

How many cases do you want to import?

☒ All of the cases

☐ The first 1000 cases.

☐ A random percentage of the cases (approximate): 10 %

Text import wizard

- SPSS may complain about invalid variable names, but it fixes them just fine.
- Press Next, then Finish.

Text Import Wizard - Step 5 of 6

Specifications for variable(s) selected in the data preview

 Data format is determined from the values present in the first 200 records.
If a column contains multiple data types in the first 200 records, the variable type is set to string.
The length (number of characters) for string variables is determined by the longest value present in the first 200 records. If subsequent records have longer values, they will be truncated.

Variable name: Original Name:

Data format:

Data View

- Your data should now be imported like this.
- You can clear the “V1” and “subject” variables if you want (but they don’t hurt either)

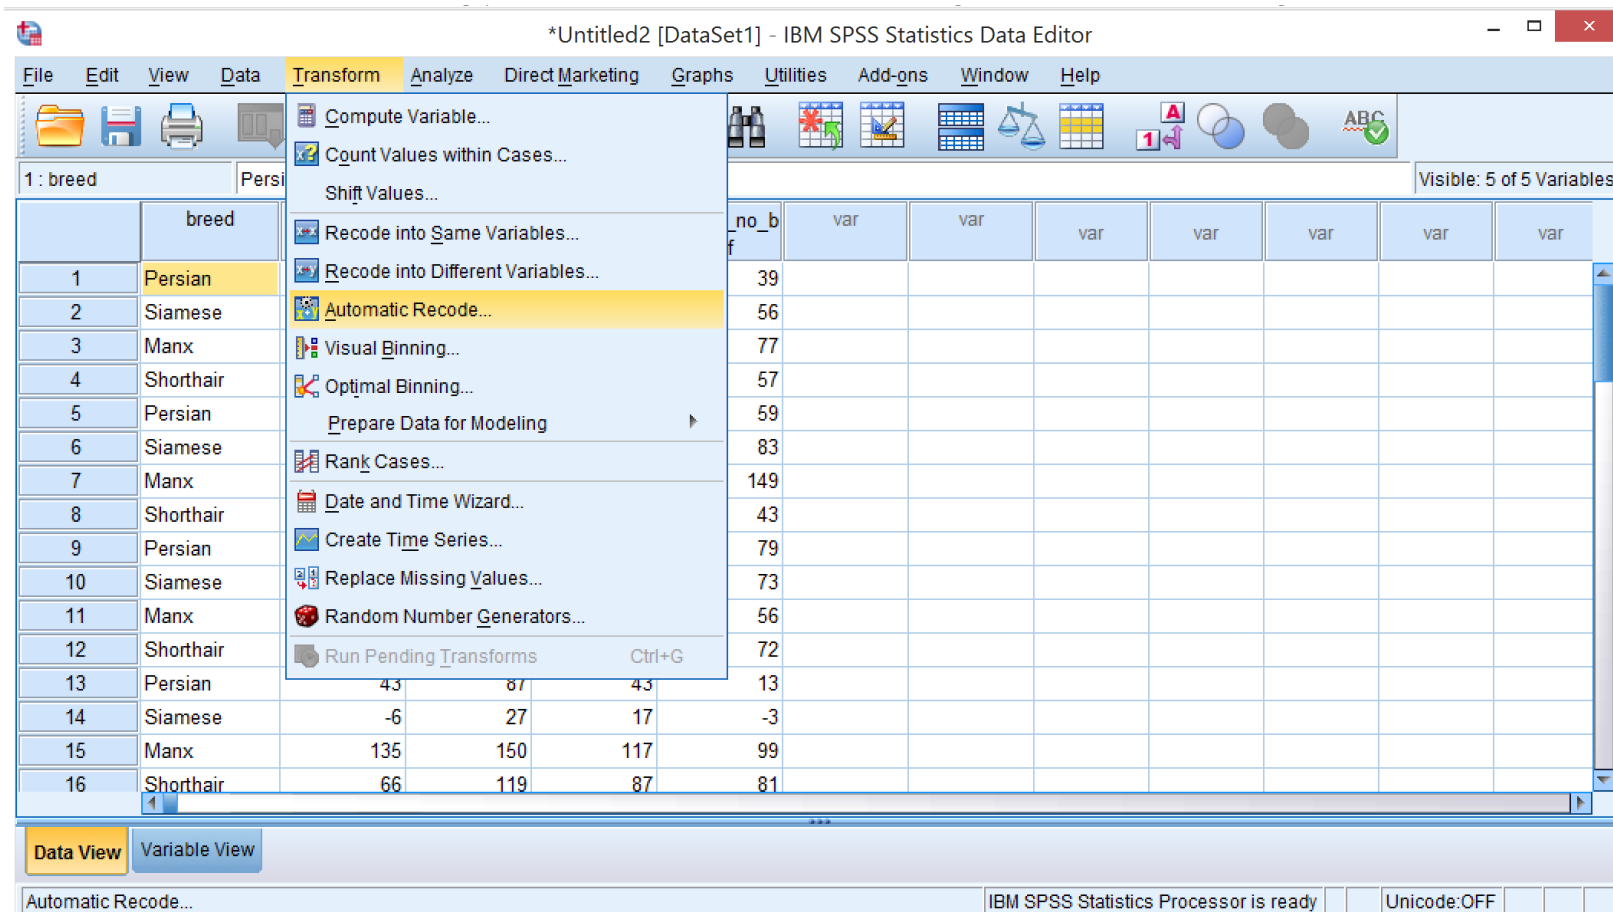

The screenshot shows the IBM SPSS Statistics Data Editor window titled '*Untitled2 [DataSet1] - IBM SPSS Statistics Data Editor'. The interface includes a menu bar (File, Edit, View, Data, Transform, Analyze, Direct Marketing, Graphs, Utilities, Add-ons, Window, Help) and a toolbar with various icons. The main data area is in 'Data View' and displays 16 rows of data. The columns are labeled V1, subject, breed, fish_beef, fish_no_beef, no_fish_beef, no_fish_no_b_eef, and several empty 'var' columns. The data represents 16 different cats with their breed, fish consumption, and other metrics.

	V1	subject	breed	fish_beef	fish_no_beef	no_fish_beef	no_fish_no_b_eef	var	var	var	var	var
1	1	1	Persian	63	91	71	39					
2	2	2	Siamese	70	102	76	56					
3	3	3	Manx	83	111	82	77					
4	4	4	Shorthair	80	107	81	57					
5	5	5	Persian	79	119	78	59					
6	6	6	Siamese	98	132	100	83					
7	7	7	Manx	161	209	191	149					
8	8	8	Shorthair	57	91	57	43					
9	9	9	Persian	76	125	94	79					
10	10	10	Siamese	93	126	98	73					
11	11	11	Manx	104	107	102	56					
12	12	12	Shorthair	69	101	90	72					
13	13	13	Persian	43	87	43	13					
14	14	14	Siamese	-6	27	17	-3					
15	15	15	Manx	135	150	117	99					
16	16	16	Shorthair	66	119	87	81					

At the bottom of the window, there are tabs for 'Data View' (selected) and 'Variable View'. The status bar at the very bottom indicates 'IBM SPSS Statistics Processor is ready' and 'Unicode:OFF'.

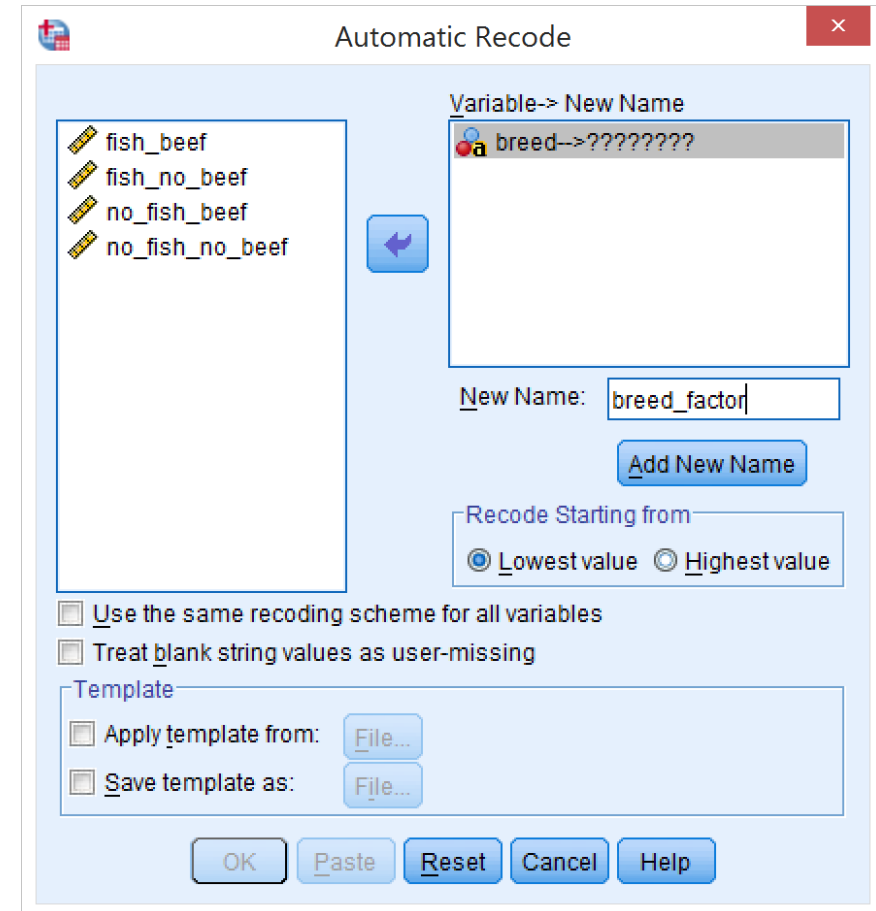

Recode breed into a discrete factor

- From the Transform menu select “Automatic Recode...”
- (If you are working from the SPSS .sav file for the assignment, you can skip this step).

Recode breed into a discrete factor

- Select “breed” from the list on the left and click the arrow to move it to the right
- Enter a new name for the recoded variable
- Recode starting from “Lowest value” is fine for our purposes
- This will assign a different number to each breed, starting alphabetically (i.e. with Manx).
- Click “Add New Name” and then OK

You should now have a new variable “breed_factor”

*Untitled2 [DataSet1] - IBM SPSS Statistics Data Editor

Data View Variable View

IBM SPSS Statistics Processor is ready Unicode:OFF

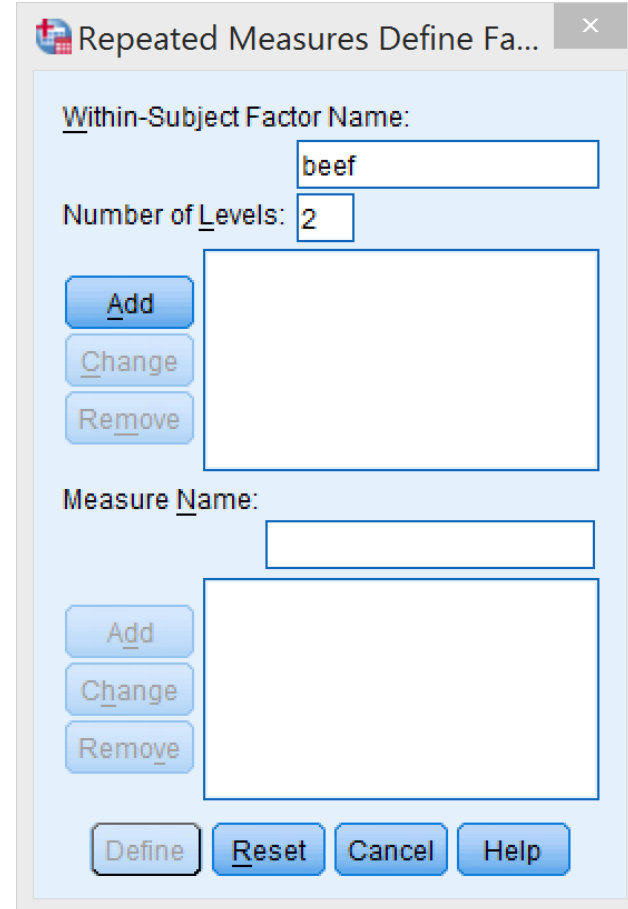

Run the analysis

- From the Analyze menu, select General Linear Model and Repeated Measures...

Run the analysis

- First, you have to re-code the data (i.e. split the columns back up into the two within-subject factors)
- Add the name for the first factor (“beef”) and the number of levels (2)
- Click “Add”

The image shows the 'Repeated Measures Define Factor' dialog box in SPSS. The 'Within-Subject Factor Name' field contains the text 'beef'. The 'Number of Levels' field contains the number '2'. There are three buttons ('Add', 'Change', 'Remove') to the left of a large empty rectangular box. Below this box, the 'Measure Name' field is empty, followed by another large empty rectangular box with its own set of 'Add', 'Change', and 'Remove' buttons. At the bottom of the dialog are four buttons: 'Define', 'Reset', 'Cancel', and 'Help'.

Assign within-subjects variables

- Click on each column name, then on the corresponding level of the within subjects variables and then on the arrow to assign it.
- You need to decide which level corresponds to which numbers
 - e.g. 1,1 could correspond to beef, fish and 2,2 could correspond to no fish, no beef, etc.

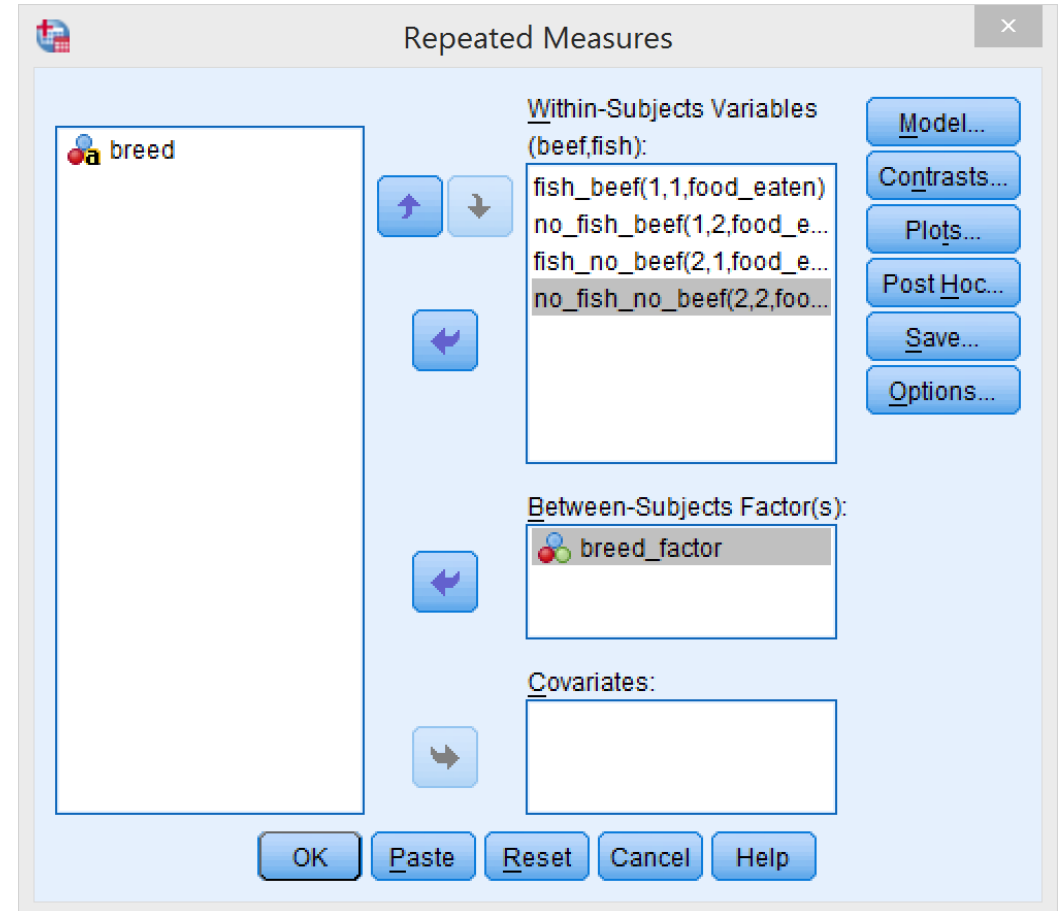

Assign within-subjects variables

- Click each corresponding level of the within subjects variables, then on the column name on the left, and then on the arrow to assign it.
- You need to decide which level corresponds to which numbers
 - e.g. 1,1 could correspond to beef, fish and 2,2 could correspond to no fish, no beef, 1,2 could correspond to beef, no fish, and 2,1 could correspond to no beef, fish
- If you get this wrong, you'll be very confused later if there's an interaction!

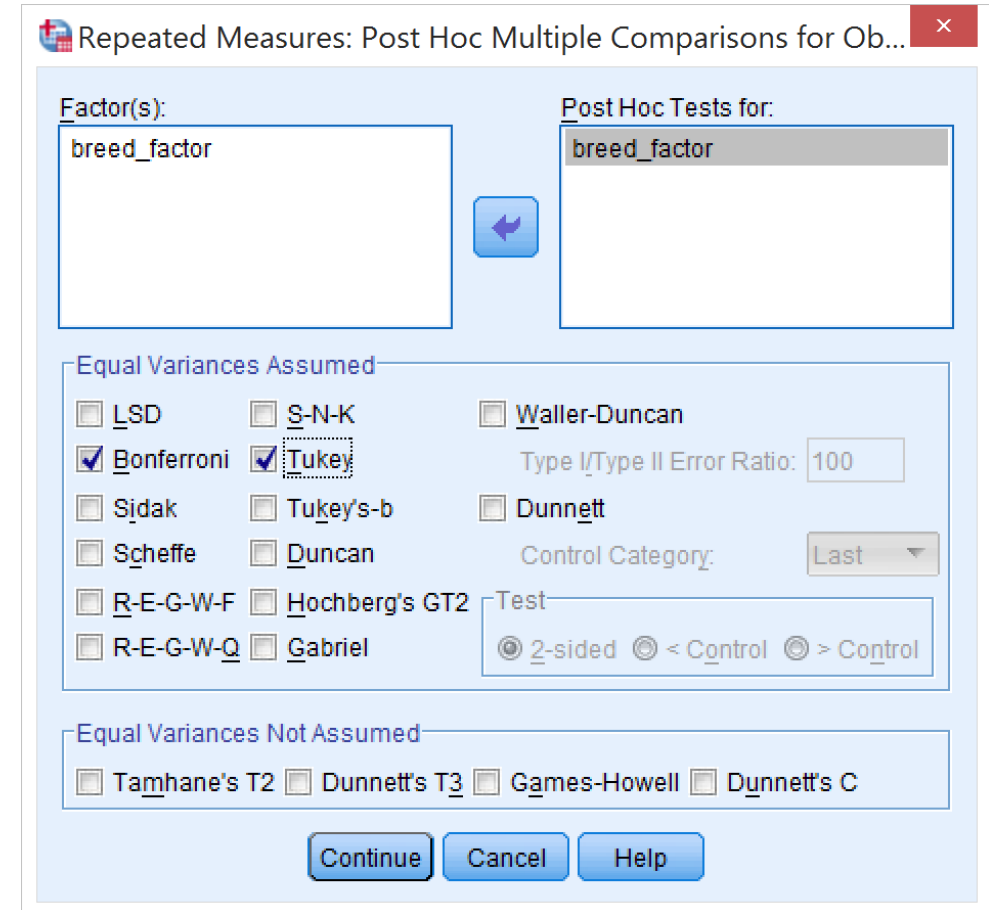

Assign between-subjects factor

- Assign the recoded factor (breed_factor) to the Between-Subjects Factor(s) field.

Post-hoc comparisons

- Click “Post Hoc...”
- Note that only factors with 3 or more levels are shown in the post hoc window
- Select “breed_factor” and move it over to the “Post hoc tests for” field
- Select any tests you want, e.g. Bonferroni and Tukey
- Click “Continue”

The image shows the "Repeated Measures: Post Hoc Multiple Comparisons for Observed Tests" dialog box in SPSS. The "Factor(s)" list contains "breed_factor". The "Post Hoc Tests for:" list also contains "breed_factor". Under "Equal Variances Assumed", the following tests are selected: Bonferroni, Tukey, and Tukey's-b. The "Type I/Type II Error Ratio" is set to 100. The "Control Category" is set to "Last". Under "Equal Variances Not Assumed", no tests are selected. The "Test" section shows "2-sided" selected. The "Continue", "Cancel", and "Help" buttons are at the bottom.

Options

- Click “Options...”
- Get marginal means for all main effects and the three way interaction (the two-way interactions are less interesting)
- Get descriptive statistics and estimates of effect size
- Get homogeneity tests
- Click “Continue”
- Click “OK” to run the analysis.

The image shows the "Repeated Measures: Options" dialog box in SPSS. The "Factor(s) and Factor Interactions:" list on the left contains: (OVERALL), breed_factor, beef, fish, breed_factor*beef, breed_factor*fish, beef*fish, and breed_factor*beef*fish. The "Display Means for:" list on the right contains: breed_factor, beef, fish, beef*fish, and breed_factor*beef*fish. The "Compare main effects" checkbox is unchecked. The "Confidence interval adjustment" dropdown is set to "LSD(none)". In the "Display" section, the following options are checked: Descriptive statistics, Estimates of effect size, Homogeneity tests, and Residual SSCP matrix. Other options like Transformation matrix, Observed power, Parameter estimates, SSCP matrices, Spread vs. level plot, Residual plot, Lack of fit, and General estimable function are unchecked. At the bottom, the "Significance level:" is set to ".05" and "Confidence intervals are 95.0 %". The "Continue", "Cancel", and "Help" buttons are at the bottom right.

Output

- Here you have (almost) everything you need for your homework report
- First, get the descriptive statistics table
- You can edit this table by double-clicking on it

Descriptive Statistics				
	breed_factor	Mean	Std. Deviation	N
fish_beef	Manx	108.30	35.097	10
	Persian	75.40	20.961	10
	Shorthair	62.60	17.122	10
	Siamese	69.00	42.045	10
	Total	78.83	34.341	40
no_fish_beef	Manx	116.10	40.154	10
	Persian	85.70	24.432	10
	Shorthair	78.30	20.876	10
	Siamese	79.30	34.916	10
	Total	89.85	33.698	40
fish_no_beef	Manx	134.90	41.235	10
	Persian	106.30	20.056	10
	Shorthair	98.00	21.833	10
	Siamese	102.00	40.642	10
	Total	110.30	34.527	40
no_fish_no_beef	Manx	88.30	36.363	10
	Persian	59.90	24.076	10
	Shorthair	56.40	22.127	10
	Siamese	64.10	38.740	10
	Total	67.18	32.533	40

Output

- After double-clicking the table, right-click it and select TableLooks...
- Select “Academic”
- This will remove all vertical lines
- According to APA style, tables should not have vertical lines.

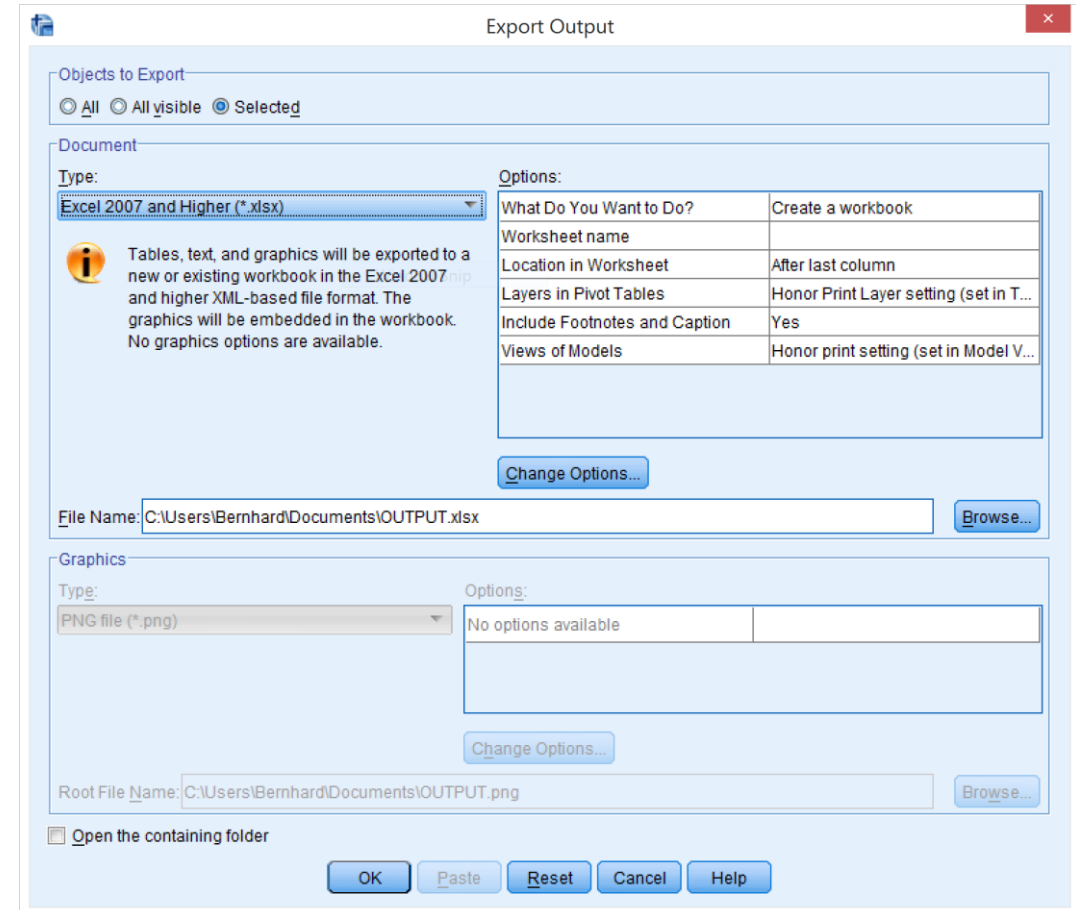

Output

- Still in the table editing mode, double-click on the condition labels to edit them into something nicer-looking

Descriptive Statistics				
	breed_factor	Mean	Std. Deviation	N
fish_beef	Manx	108.30	35.097	10
	Persian	75.40	20.961	10
	Shorthair	62.60	17.122	10
	Siamese	69.00	42.045	10
	Total	78.83	34.341	40

	Shorthair	56.40	22.127	10
	Siamese	64.10	38.740	10
	Total	67.18	32.533	40

Output

- Now it's time to get this table in Excel (and then in Word). Exit the table edit mode by clicking outside it, then right-click it and select "Export..."
- Select a file name and path that you can find again later on...
- Click OK.
- Now open the file in Excel

Prepare table in Excel

- You need to add a column for the Standard error of the mean.
- Remember the formula? It's standard deviation / square root of the sample size
- In a new column in Excel, enter that formula (in this case, it should be `=D3/SQRT(E3)`)
- Press ENTER, then double-click the little square at the lower-right corner of the cell

=D3/SQRT(E3)						
	A	B	C	D	E	F
1	Descriptive Statistics					
2	Breed		Mean	Std. Deviation	N	
3	Fish, Beef	Manx	108.30	35.097	10	=D3/SQRT(E3)
4		Persian	75.40	20.961	10	
5		Shorthair	62.60	17.122	10	
6		Siamese	69.00	42.045	10	
7		Total	78.83	34.341	40	
8	No fish, No beef	Manx	116.10	40.154	10	
9		Persian	85.70	24.432	10	
10		Shorthair	78.30	20.876	10	
11		Siamese	79.30	34.916	10	
12		Total	89.85	33.698	40	
13	Fish, No beef	Manx	134.90	41.235	10	
14		Persian	106.30	20.056	10	
15		Shorthair	98.00	21.833	10	
16		Siamese	102.00	40.642	10	
17		Total	110.30	34.527	40	
18	No Fish, No beef	Manx	88.30	36.363	10	
19		Persian	59.90	24.076	10	
20		Shorthair	56.40	22.127	10	
21		Siamese	64.10	38.740	10	
22		Total	67.18	32.533	40	
23						
24						

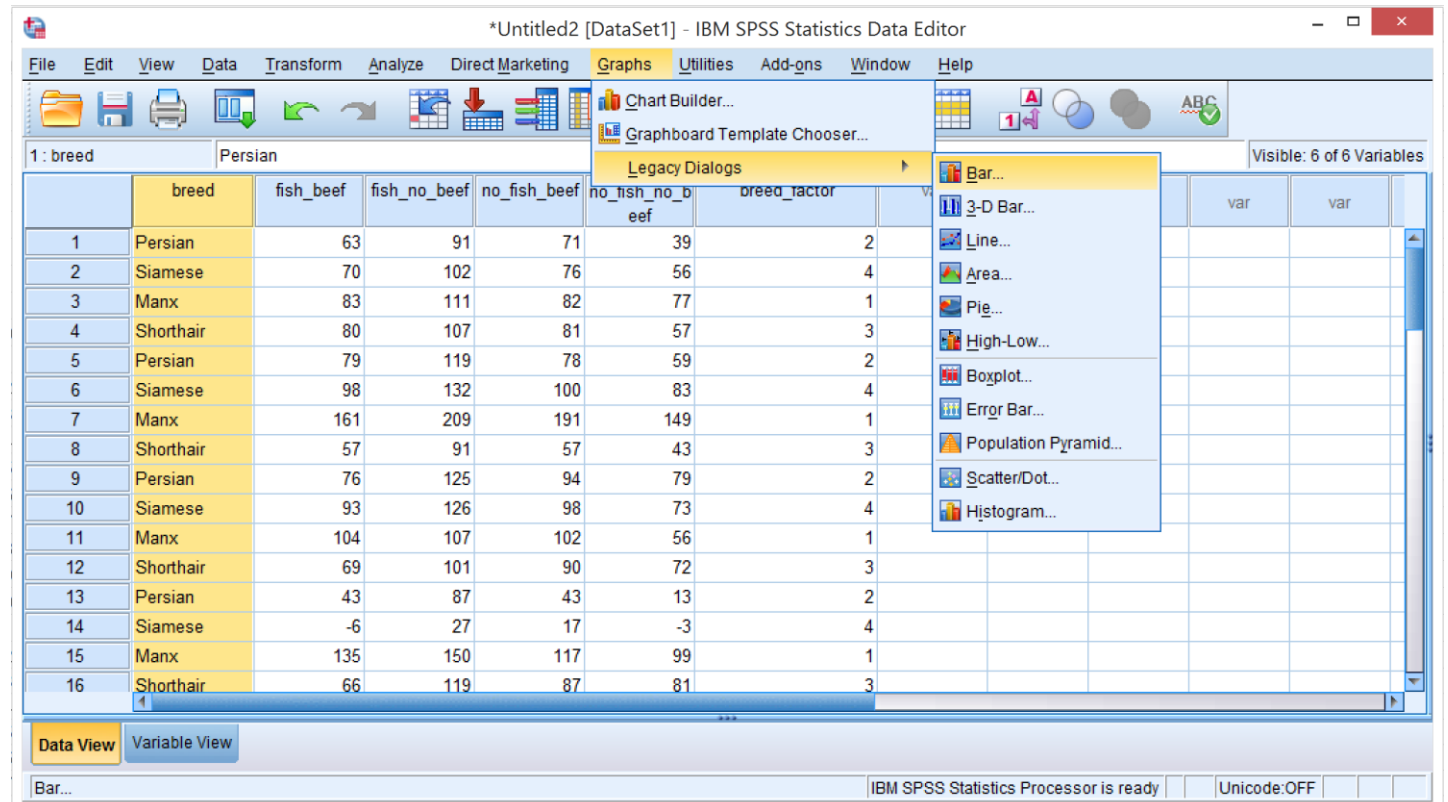

Prepare table in Excel

- Now just fix the formatting (Right-click + Format cells...)
 - Set Number format to Number with 2 decimal places
 - Add the horizontal lines (Format cells → Border)
 - Align the “Breed” label by unclicking “Merge and Center”
- When you’re done, copy and paste this table to Word.
- Don’t forget to add a caption!

Descriptive Statistics					
Breed		Mean	Std. Deviation	N	SE
Fish, Beef	Manx	108.30	35.097	10	11.0986
	Persian	75.40	20.961	10	6.628558
	Shorthair	62.60	17.122	10	5.414384
	Siamese	69.00	42.045	10	13.29578
	Total	78.83	34.341	40	5.429724
No fish, No beef	Manx	116.10	40.154	10	12.69773
	Persian	85.70	24.432	10	7.72593
	Shorthair	78.30	20.876	10	6.601431
	Siamese	79.30	34.916	10	11.04139
	Total	89.85	33.698	40	5.328149
Fish, No beef	Manx	134.90	41.235	10	13.03964
	Persian	106.30	20.056	10	6.342187
	Shorthair	98.00	21.833	10	6.904105

	Persian	59.90	24.076	10	7.613511
	Shorthair	56.40	22.127	10	6.997142
	Siamese	64.10	38.740	10	12.25058
	Total	67.18	32.533	40	5.143939

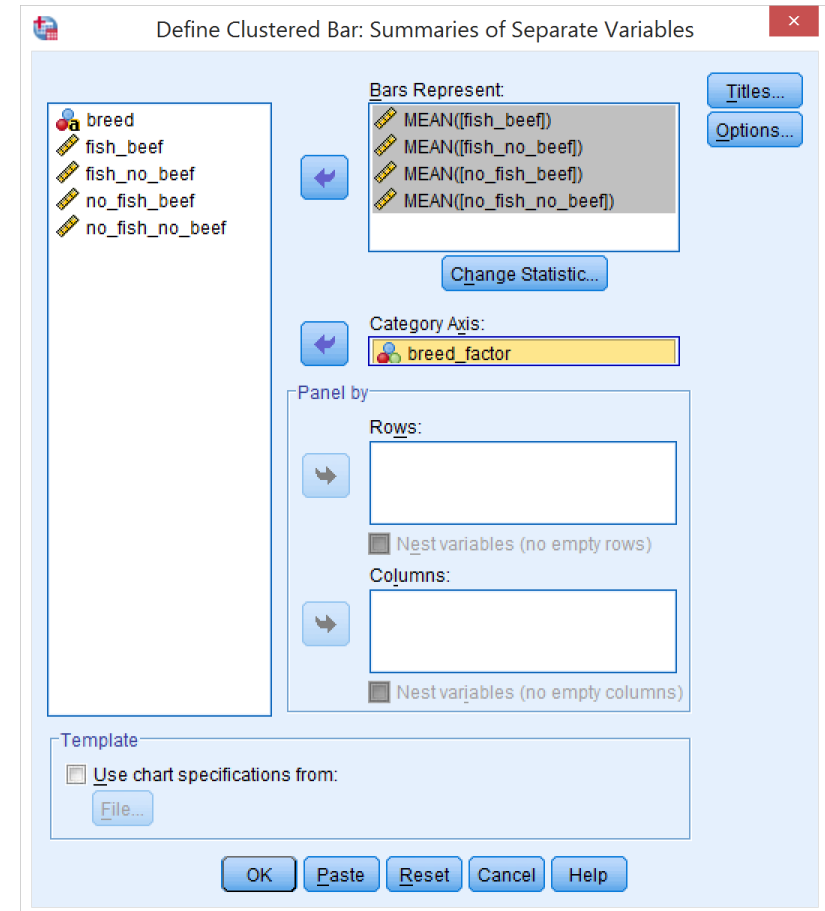

Make plots

- In SPSS, go to Graphs → Legacy Dialogs → Bar...

Make plots

- Assign the four different beef/fish columns to “Bars represent”
 - The default statistic (“MEAN”) is exactly what we want
- Assign the between-subject factor (“breed_factor”) to “Category Axis”

Add error bars

- Click “Options...”
- Check “Display error bars”
- The default setting (95% CI) is what we want.
- Click “Continue”

Final touches

- Double-click the resulting graph to open it in the chart editor
- Double-click axis and legend labels to edit them and make them look nice
- There we go!

The hypothesis tests

- Do NOT copy and paste any SPSS output directly
- Look at the tables and pick out the correct numbers
- First, for the within subjects effects, look at Mauchly's test of sphericity
- In this case, there is no Sig value, since neither beef nor fish have more than 2 levels
- If one of the tests is significant, check the Greenhouse-Geisser Epsilon
 - If it's over .75, use the Huynh-Feldt Epsilon to correct for sphericity
 - If it's under .75, use the G-G Epsilon

Mauchly's Test of Sphericity^a

Measure: food_eaten

Within Subjects Effect	Mauchly's W	Approx. Chi-Square	df	Sig.	Epsilon ^b		
					Greenhouse-Geisser	Huynh-Feldt	Lower-bound
beef	1.000	.000	0	.	1.000	1.000	1.000
fish	1.000	.000	0	.	1.000	1.000	1.000
beef * fish	1.000	.000	0	.	1.000	1.000	1.000

Tests the null hypothesis that the error covariance matrix of the orthonormalized transformed dependent variables is proportional to an identity matrix.

a. Design: Intercept + breed_factor
Within Subjects Design: beef + fish + beef * fish

b. May be used to adjust the degrees of freedom for the averaged tests of significance. Corrected tests are displayed in the Tests of Within-Subjects Effects table.

The hypothesis tests

- The results of the F-tests on the Within-Subjects factors are in the “Tests of Within-Subjects Effects” table
- In the “Sig.” column, check which p-values are below .05
 - You have to report those effects in detail
- The correct error term is the first one listed *below* the predictor
- If you need to make a sphericity correction, pick the correct row (see last slide), otherwise use the values from the row “Sphericity assumed”

The hypothesis tests

- Note down:
 - df numerator (df effect)
 - df denominator (df error)
 - F-value
 - p-value
 - Partial Eta squared
- Then report them like this in the text:
- There was a significant effect of beef, $F(1, 36) = 8.63$, $\eta_P^2 = 0.01$, $p < .01$.
- Do this for every significant factor.

Source		Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared

	Lower-bound	3231.650	36.000	89.768			

The hypothesis tests

- For those factors with only two levels, you can interpret and report the marginal means directly
- There was a significant effect of beef, $F(1, 36) = 8.63$, $\eta_p^2 = 0.01$, $p < .01$. When there was beef present in the food, cats ate more food on average (88.7 g) than when there was no beef in the food (84.3 g).

3. beef

Measure: food_eaten

beef	Mean	Std. Error	95% Confidence Interval	
			Lower Bound	Upper Bound
1	84.338	4.800	74.603	94.072
2	88.738	4.930	78.739	98.736

The hypothesis tests

- In the presence of significant interactions, you do not have to interpret the main effects and marginal means in this way (as they are modulated by the interaction).
- But you do have to interpret the interaction
- The fish and beef main effects were modulated by a significant two-way interaction, $F(1, 36) = 571.82$ $\eta_p^2 = 0.17$, $p < .01$. This interaction showed that, when no beef was in the food, the cats ate more when there was fish in the food (mean eaten = 110 g) than when there was no fish (mean eaten = 67 g). When the food contained beef, cats ate less food when there was also fish in the food (mean eaten = 79 g) than when there was only beef (mean eaten = 90 g).

5. beef * fish

Measure: food_eaten

beef	fish	Mean	Std. Error	95% Confidence Interval	
				Lower Bound	Upper Bound
1	1	78.825	4.830	69.030	88.620
	2	89.850	4.914	79.883	99.817
2	1	110.300	5.142	99.871	120.729
	2	67.175	4.932	57.172	77.178

Assumption tests

- Mauchly's test (see previous slides)
- Levene's test
 - See table in the output
 - Note that this is split by within-subject conditions
 - Report if one or more of the tests are significant

Levene's Test of Equality of Error Variances^a

	F	df1	df2	Sig.
fish_beef	2.787	3	36	.055
no_fish_beef	1.196	3	36	.325
fish_no_beef	2.526	3	36	.073
no_fish_no_beef	1.211	3	36	.320

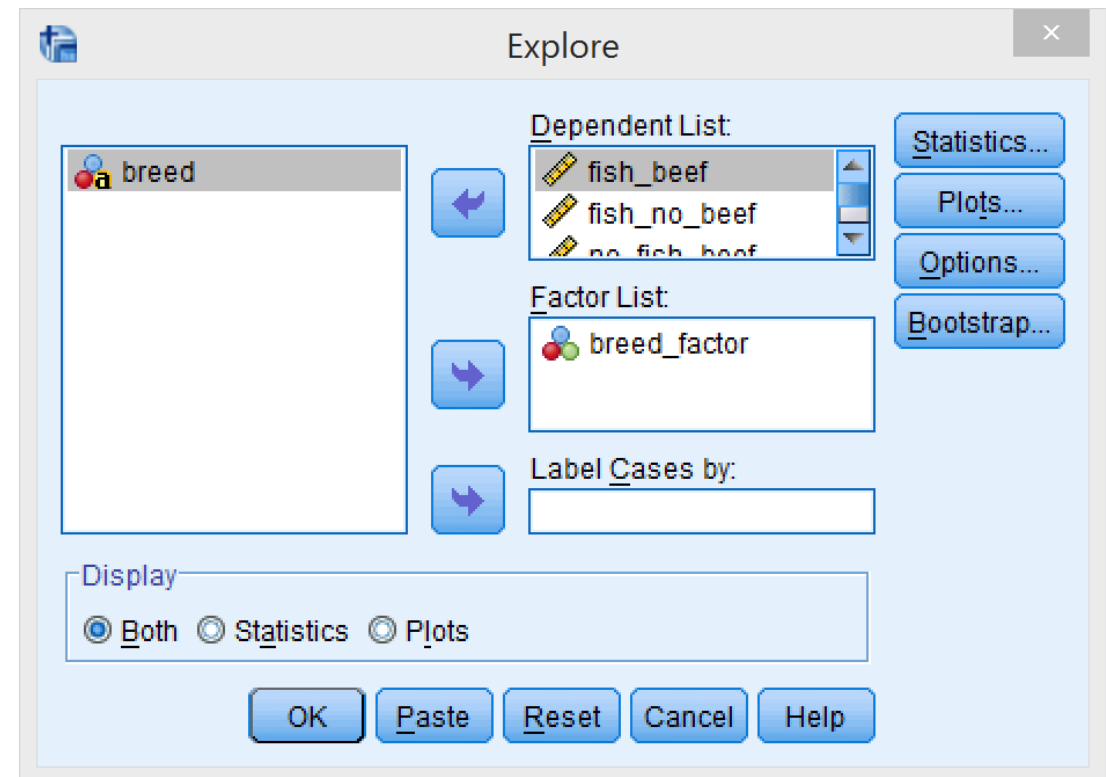

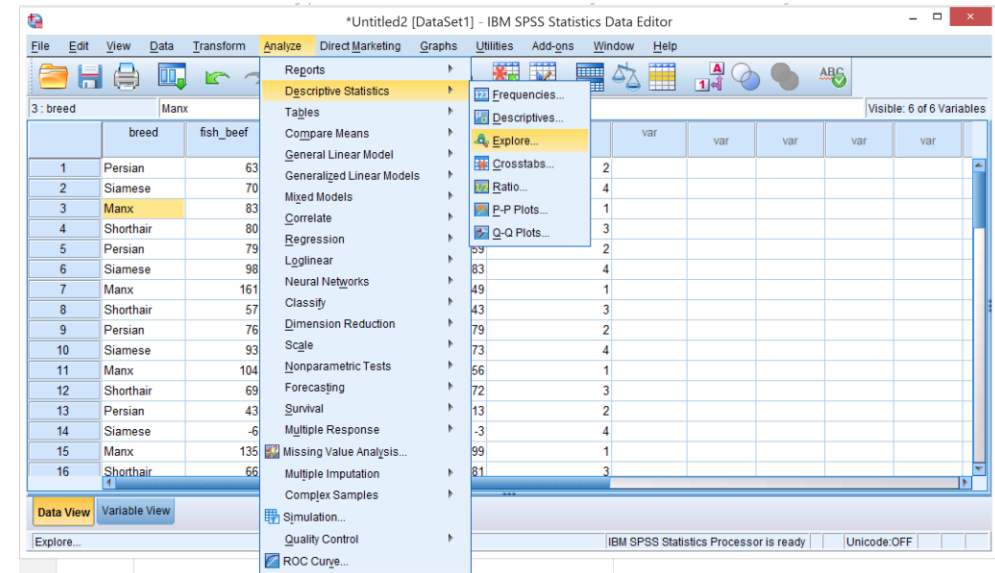

Tests the null hypothesis that the error variance of the dependent variable is equal across groups.

a. Design: Intercept + breed_factor

Within Subjects Design: beef + fish + beef * fish

Assumption tests

- Normality
 - Surprisingly involved!
- Go to Analyze → Descriptive Statistics → Explore...
- Move all within-subjects columns to “Dependent List”
- Move the between-subjects factor to “factor list”
- Click on “Options...”

Assumption tests

- Check “Normality plots with tests”
- Click “Continue”
- Click “OK”
- Check the resulting table for p-values below .05
- If there are any, report them.

Tests of Normality							
breed_factor		Kolmogorov-Smirnov ^a			Shapiro-Wilk

	Siamese	.186	10	.200 [*]	.964	10	.831

*. This is a lower bound of the true significance.

a. Lilliefors Significance Correction

Post-hoc tests

- Look at the “Multiple Comparisons” table
- Choose the test with the highest power (Tukey’s in this case)
- Check Sig column for $< .05$
- Report those effects along with the means

Multiple Comparisons

Measure: food_eaten

	(I) breed_factor	(J) breed_factor	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound
Tukey HSD	Manx	Persian	30.08	13.597	.139	-6.55	66.70
		Shorthair	38.08*	13.597	.039	1.45	74.70

	Siamese	Manx	-33.30	13.597	.116	-71.26	4.66
		Persian	-3.22	13.597	1.000	-41.19	34.74
		Shorthair	4.78	13.597	1.000	-33.19	42.74

Based on observed means.

The error term is Mean Square(Error) = 924.457.

*. The mean difference is significant at the .05 level.

Writing things up

- Refer to the “Homework 4 worked.docx” file for guidance.
